Table of Contents

Executive Summary

Introduction

The DeKalb County School District has undertaken a comprehensive facility planning process to assess the current state of its educational infrastructure and to inform future strategic decisions. This report presents a districtwide analysis across five key dimensions: **Enrollment, Capacity** and **Utilization, Facility Condition, Educational Adequacy**, and **Cost per Student.** This report is diagnostic in nature and does not provide any recommendations for future projects. This is a foundational document that will serve as a companion for an online facilities dashboard and support all DCSD planning efforts.

Dashboard Link:

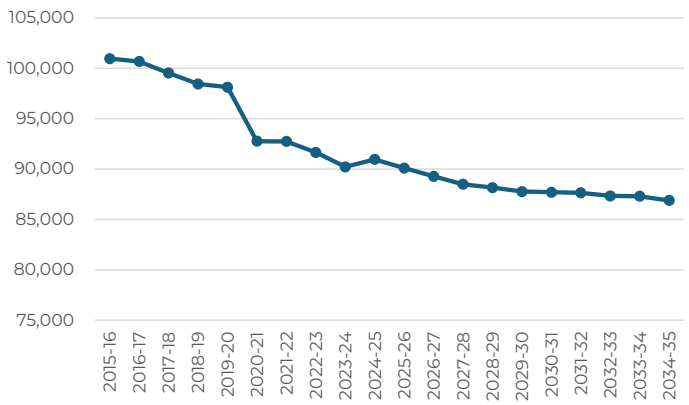
Key Findings

Enrollment Trends

Enrollment projections indicate a modest decline over the next decade. These projections are derived using a cohort-survival methodology that incorporates live birth data, historical enrollment patterns, and housing trends. Two distinct projection models were developed:

- **Live-In Projections**: Students residing in each attendance zone.
- Adapted **Attendance Projections**: Students attending each school, accounting for transfers and school choice.

Historical and Projected Enrollment



Source: DCSD, HPM

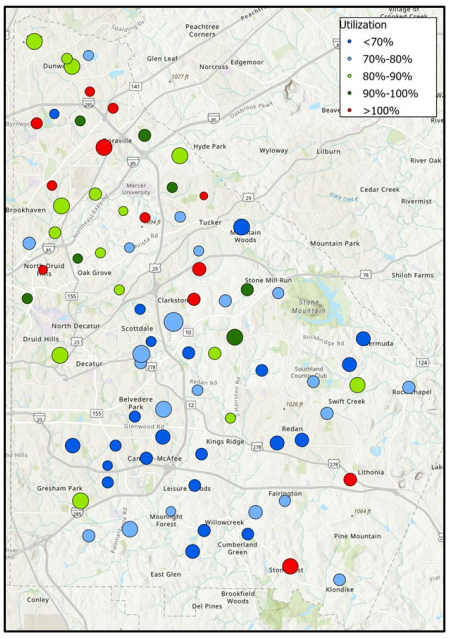
Overall enrollment is projected to continue to decline slightly over the next 10 years to around 86,000 by the 2034-35 school year.

Capacity and Utilization

Instructional capacity was calculated based on the number of instructional units and core classrooms. Utilization rates vary significantly across the district, with some schools operating well below or above optimal thresholds.

At the districtwide level, there is a substantial excess of instructional capacity, particularly within elementary schools. This surplus presents both operational challenges and strategic opportunities:

- At the elementary schools, there is a surplus of 11,042 seats
- At the middle schools, there is a surplus of 5,999 seats
- At the high schools, there is a surplus of 4,1441 seats



Source: DCSD, HPM

Executive Summary

Facility Condition

Facility conditions were evaluated using the Facility Condition Index (FCI), which compares the cost of needed repairs to the theoretical cost of facility replacement. The inverse of the FCI yields the Facility Condition Assessment (FCA) Score, ranging from 0 to 100, with higher scores indicating better facility health.

Overall the average FCA Score of the District is 92% and if no investment is made, that score is projected to decrease to 84.5% in 2030. The estimated cost that makes up the current existing deficiencies is approximately $696M and that cost is projected to increase to $1.35B in 2030, if no action is taken.

Executive Summary

Educational Adequacy

Educational adequacy assessments measured each facility against DeKalb County School District standards and national best practices. Key findings include:

- Deficiencies in required instructional and support spaces.
- Undersized or missing specialized areas such as auditoriums, labs, and media centers.
- Site-related issues including inadequate acreage and traffic flow infrastructure.

Four elementary school models were used to account for the wide range of school sizes across the district (4 sections, 4.5 sections, 5 sections, and 6 sections per grade).

Many of the schools that are scoring less than 70% are significantly undersized compared to the desired building standards.

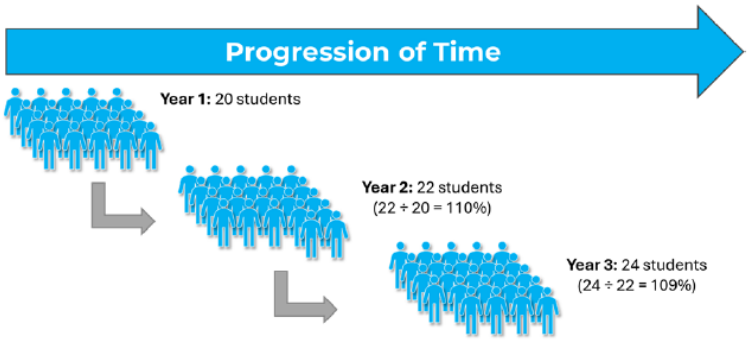
Enrollment Projections

Methodology

The methodology for this enrollment projection study is based on student residence, not actual attendance. Six years of student database records were matched to an address through a process called geocoding. This allows us to count the number of students residing within each attendance boundary, by school year and grade.



These counts are used to calculate a "survival ratio" of how many students progress from one grade to the next, which becomes the basis for projecting future enrollment. For example, if we observe that every year there are fewer 6th graders residing in attendance boundary than there were 5th graders the year prior, that calculates a 5th to 6th grade survival ratio of less than 100%.

Historical birth data by elementary boundary is used to calculate survival ratios for Kindergarten, by comparing the number of births within an area to the number of Kindergarten students that reside in an attendance zone five years later. These trends are observed for all grade levels and attendance boundaries and can be applied to future years to help project enrollment.

Historical Enrollment

PK-12 live-in enrollment in DCSD has declined from 101,177 in 2015-16 to 91,445, a decrease of 9,732 students, or 9.6%. The largest percentage of decline has been seen at the elementary school level, where 14.5% of the enrollment has been lost during this time.

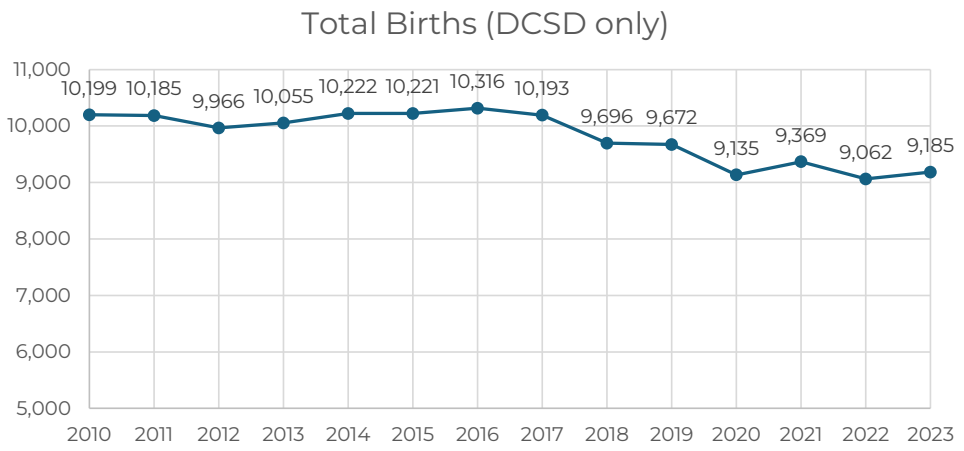
Note: figures shaded in red indicate relative high enrollments and blues indicate relative low enrollments. This illustrates smaller classes replacing larger classes over time.

Enrollment Projections

Birth Data

Birth data by elementary attendance area was collected for the years 2010 through 2023.

Births data was collected by elementary attendance area of residence and correlated based on the academic school year. All births are within the DCSD boundaries and do not include any out of boundary births within DeKalb County (e.g. City Schools of Decatur, Atlanta Public Schools, etc.)



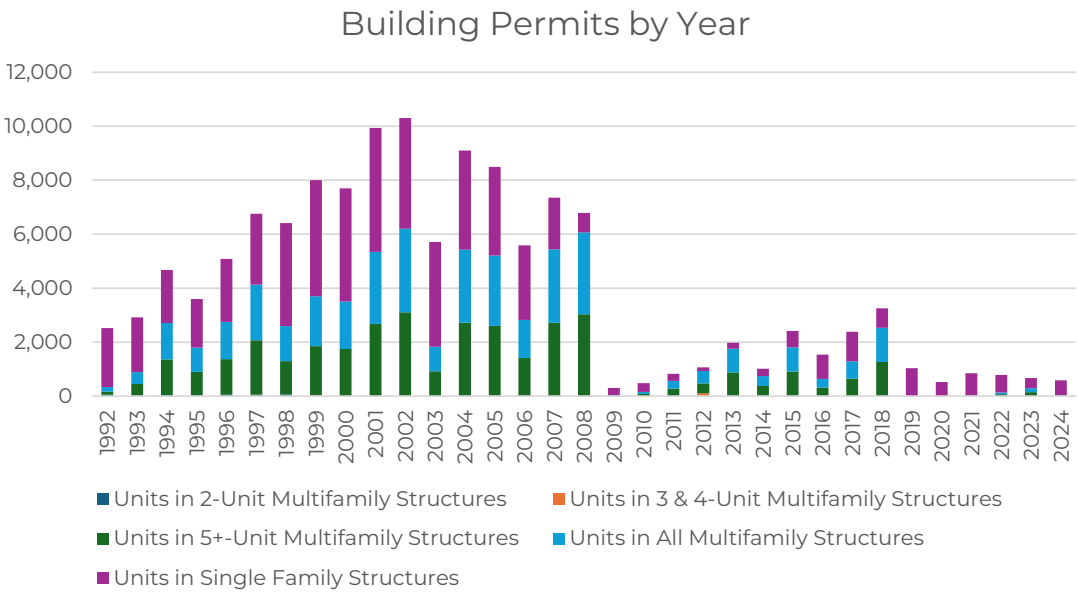
Source: Georgia Department of Health

From 2010 to 2023 births within DCSD have decreased by 1,014, or 9.9%.

Housing Data

A very common misconception with enrollment projections is that housing growth should be directly correlated to increases in enrollment. If these were the case, the only way the enrollment could decline would be if housing were to be removed from the system. The cohort-survival method captures the nuance that is inherent with housing data. It is possible that building permits are issued at one time and then take months or sometimes years to be constructed. Also, not every new home is occupied by families coming in to the county from the outside, in many cases families move around within the district and previous housing is not necessarily replaced by the same type of resident.

The table and chart below illustrate the number of building permits reported by municipality by year going back to the year 1992. The number of building permits issued per year has decrease from its recent peak in 2018.



Source: SOCDS, US Department of Housing and Urban Development

Enrollment Projections

Survival Ratios

The table below shows the observed survival ratios live DCSD students over the past 9 years. Ratios are calculated by dividing the current enrollment for one grade by the enrollment of the previous grade one year earlier (e.g. survival ratio for first grade is calculated by dividing the current first grade enrollment by the kindergarten enrollment the previous year. The kindergarten ratio is calculated by dividing current kindergarten by the birth count 5-years earlier).

Shaded colors indicate relative highs in red and relative lows in blue for each grade level. For Example, the 2020-21 school year shows the lowest survival ratios observed in almost all grades due to the pandemic.

The 3-year simple average served as a starting point for this projection and adjustments were made from there. This discounts the changes in trend that were observed during the pandemic.

School Year	Birth -K	K-1	1-2	2-3	3-4	4-5	5-6	6-7	7-8	8-9	9-10	10-11	11-12

Enrollment Projections

Projected Enrollment

Enrollment is projected to decline from 91,445 students in the 2024-25 school year to 87,372 students in the 2034-35 school year. The largest percentage decrease over this time is projected at the elementary school level.

Grade	2024-25 (Actual)	2025-26	2026-27	2027-28	2028-29	2029-30	2030-31	2031-32	2032-33	2033-34	2034-35

Adapted Attendance Projections

The projections shown in this report are based on the number of students residing in each attendance area. The following pages will detail historical and projected live-in enrollment by attendance boundary as well as live-attend matrixes that cross reference attendance boundary of residence with school or program of attendance. Projections by school or program of attendance have also been created based on the current choice patterns applied to the live-in projections.

Conclusion

The District should continue to monitor enrollment along with changing funding mechanisms, choice practices, demographic factors. An annual enrollment projection is recommended due to the nature of the Districts capital program and the establishment of new trends after the pandemic.

Capacity and Utilization

Methodology

School facility capacity refers to the number of students that can be accommodated in instructional programs without the need for portable classrooms or other temporary solutions. Typically, capacity is calculated by multiplying the number of classrooms by a standard number of students per room, while also accounting for the required number of classrooms dedicated to non-core subjects such as specials, resource, and special education.

After determining the number of classrooms for a facility, a proportion of core and non-core classrooms is calculated based on the percentages in the table below.

	Core %	Non-Core %	=	Specials/ Connections %	+	Resource %	+	Special Education %
Elementary	67%	33%	=	15%	+	13%	+	5%
Middle	58%	42%	=	30%	+	8%	+	4%
High	63%	37%	=	28%	+	4%	+	5%

The remaining core classrooms are multiplied by the students per core classroom based on the grade level of the school as outlined below.

	Students Per Core Room
Elementary	24
Middle	30
High	31

Educational Adequacy

Methodology

Educational Adequacy is a process by which educational facilities are measured against the educational specifications or standards as set by the District and HPM best practices. From these standards a collection tool was established that identified number and size of space types and educational elements that should be assessed. Assessors walked all typical elementary, middle and high school buildings to collect a room inventory, verify size of spaces, and note the existence of required elements by room type. Building site standards such as acreage and separate bus and car drop off lanes were also assessed.

Elements of Educational Adequacy

Facilities are scored based on the following factors:

- Required elements that are missing from a space are given a deficiency cost
- Spaces that don't meet square footage requirement (undersized auditorium) are given a deficiency cost of the missing square feet
- Buildings that don't have all required spaces (e.g., not enough classrooms, missing a band room) are assigned 'missing space' deficiencies.
- Site issues (total acreage, bus lane, parent car queuing) are also identified as deficiencies

Identified deficiencies subtract from the overall score of a facility, with 100% representing the maximum or best score, and 0% representing the minimum or lowest score. Scoring was based on a district standard of 1,200 capacity at the middle school level and 1,600 capacity at the high school level.

At the elementary school level, four models were used, based on building capacity and number of sections per grade, to account for the wide range of schools across the district. Operationally, running elementary schools at less than 4 sections per grade is inefficient and requires supplemental staffing to meet program needs, which drives up cost per student. Since a number of schools fell between the four and five section model from a capacity standpoint, a four and a half section model was used for these schools.

Educational Adequacy

Elementary Model 1 Educational Adequacy - 4 Sections per Grade (624 Capacity)

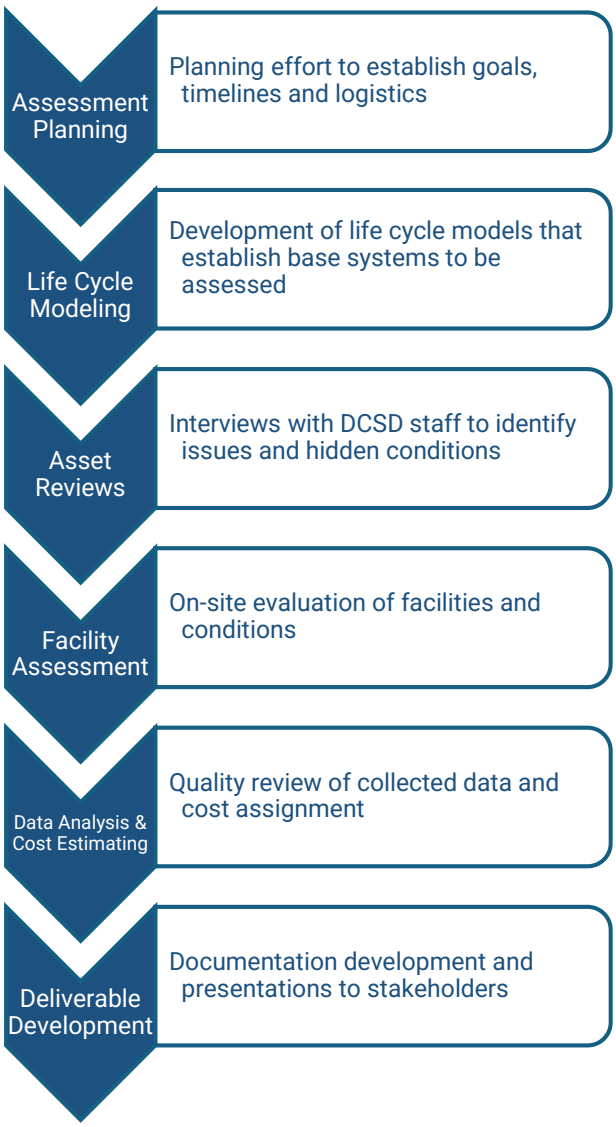
Facilities Condition

Methodology

DCSD incorporated a multiple step approach. The incorporated graphic depicts the overall process that was followed. One goal for the FCA was to gather existing institutional knowledge that can be leveraged to produce a more accurate condition analysis.



In an effort to reduce costs, assessment teams visited select DCSD campuses over a two-month period. Information was collected and compiled into Ameresco's AssetPlanner Capital Planning software with assessment data from previous assessments. All of the data was reviewed for consistency. The findings included cost estimates for repairs and replacements as well as prioritization of the needs to support better planning.

One key metric utilized in FCAs is the Facility Condition Index (FCI). This ratio helps gauge the overall health of a facility while also affording the capability to compare dissimilar facilities. The FCI is calculated by dividing the cost of repairs by the theoretical cost to replace a facility.

$$FCI = \frac{\text{Repair Cost}}{\text{Replacement Cost}}$$

To avoid confusion, in this process, a Facility Condition Assessment Score (FCA Score) is used which is calculated by subtracting the FCI from 1. This means, the higher the FCA score, the better the condition the building is in.

FCA Score = 1 minus FCI

Facility Condition Assessment Findings

Current condition needs for DCSD total approximately $696M. If no action is taken and systems reach the end of their useful life, that need increase to approximately $1.35B by the year 2030, if no action is taken. The district's overall FCA Score is approximately 92% and is modeled to decrease to 84.5% by the year 2030.

Facilities Condition

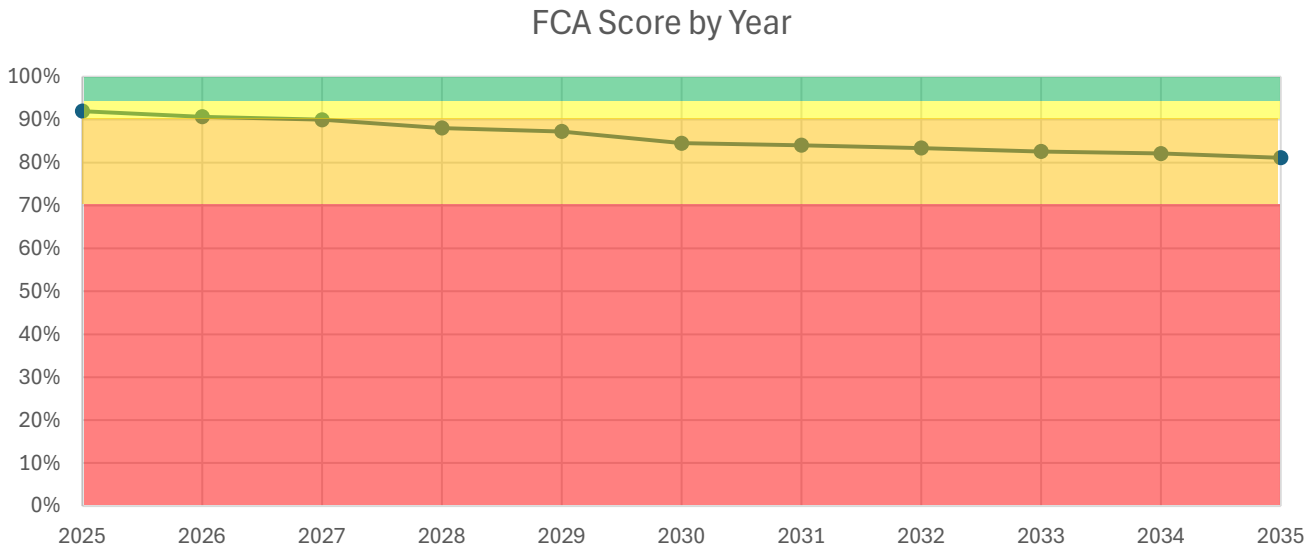
Life Cycle Renewal Forecast

Condition needs are evaluated over time based on expected future replacement timing driven by the overall useful life of a system or component. Assessors determined where components were in their overall expected useful life and entered a potential replacement data base on these factors. Utilizing the predicted timing of replacements, the life cycle renewal forecast can be determined for a building or portfolio. These replacement years and associated costs allow for the calculation of the FCA score over time. This progressive FCA Score Chart affords the opportunity to analyze when facilities will advance from one condition rating to another.

< 70%	70%-90%	90%-95%	> 95%
Critical	Poor	Fair	Good

Facility Condition Index

Capitalizing on the ability to forecast life cycle renewals, the district's overall FCA Score can be analyzed over time to indicate condition in the next ten years. The chart below shows the decline of the FCA Score as systems require replacement each year over a 10-year period. The district's current condition is rated as "Fair" with an FCA Score of 92%. After two years, the condition moves to "Poor" where it remains during the 10-year planning timeframe. This evaluation does not consider any funding.



Source: Ameresco, HPM

Facilities Condition

Needs by Discipline

The FCA data collected in DCSD has been classified by building discipline to further define which systems have the most need within the portfolio. This classification associates the following disciplines with the systems and components assessed.

- Substructure – Foundations and other structural elements
- Shell – Exterior enclosure as well as structural components
- Interiors – Interior building components such as walls, flooring, doors
- Services – Systems and components related to mechanical (HVAC), electrical and plumbing
- Equipment and Furnishings – Components such as fixed furnishings, school specific equipment
- Building Sitework – Site amenities and components such as parking, fencing, playground, lighting and utilities

The chart below illustrates current and life-cycle deficiencies by discipline. This chart is not cumulative.
